**Section 23 00 00 – Heating, Ventilating and Air Conditioning (HVAC)****GENERAL**

The current HVAC system for the existing 8,300 square foot Town Library consists of two rooftop packaged gas heating/electric cooling units, two through wall heat pump units, roof exhaust fans and local controls.

The building was renovated in 1988 including a new HVAC system including electric heat/cool rooftop units; in 2002 the rooftop units were replaced with new gas heating/electric cool rooftop units

**EXISTING CONDITIONS**

The building is provided with heated, ventilated by two rooftop packaged gas heating/electric cooling units, two through wall heat pump units, roof exhaust fans and

The following equipment provides heating, ventilating and air conditioning to the building:

<b>AREA</b>	<b>HVAC Unit</b>	<b>Make/Model</b>	<b>CFM</b>	<b>OA CFM</b>	<b>COOLING</b>	<b>HEATING</b>
Basement	(2) PTAC	Gree/ ETAC2-15HC	-	-	14.2 MBH	11.7 MBH (Electric)
Intermediate Level	RTU-2	Carrier/ 48HJE008	3,000*	600*	90 MBH	147.6 MBH (Gas)
1 <sup>ST</sup> Floor	RTU-1	Carrier/ 48HJF017	6,000*	460*	180 MBH	291 MBH (Gas)

\*Original design data.

The Basement Level is provided with two packaged through the wall air conditioning units (PTAC) that provide heating and cooling to the adjacent activity spaces. There are also two enclosed storage rooms without any HVAC. The elevator machine room is provided with a inclined transfer duct to the elevator hoistway but no other HVAC provisions.

The entire Intermediate level including the two bathrooms is provided with heating, ventilating and air conditioning by RTU-2 and the roof mounted bathroom exhaust fan. The Intermediate Level occupied space consists of several different areas of different occupancy types and exterior wall exposure types. RTU-2 provides HVAC through a duct distribution system terminating into ceiling/wall air outlets and is controlled by a single wall mounted thermostat. The bathroom exhaust is through ceiling exhaust registers into the building exhaust duct distribution system terminating into the roof mounted exhaust fan. It does not appear that the crawlspace and utility room have been provided with any HVAC provisions as required by applicable codes.

The entire First Level including the two bathrooms is provided with heating, ventilating and air conditioning by RTU-1 and the roof mounted bathroom exhaust fan. The bathroom at the entry is provided with electric baseboard heat. The First Level occupied space consists of several different areas of different occupancy types, a large interior component with skylights, enclosed offices, balcony and exterior wall exposure types. RTU-1 provides HVAC through a duct distribution system terminating into ceiling/wall/floor air outlets and is controlled by a single wall mounted thermostat. The bathroom exhaust is through ceiling exhaust registers into the building exhaust duct distribution system terminating into the roof mounted exhaust fan.

The following were noted or reported to be system operational issues:

1. Uneven heating/cooling within spaces within the same air conditioning/heating zone.
2. Thermostat locations are not optimal increasing heating/cooling related issues.
3. Crawlspace, Storage, Utility and elevator machine room have not been provided with appropriate HVAC provisions.
4. System may have never been balanced and/or commissioned.

## **EVALUATION**

BLW Engineers performed heating, cooling and ventilation calculations for each zone of the building; the building is provided with less cooling capacity than required.

The major issues with the heating, ventilating and air conditioning system is as follows:

1. Capacity: The air conditioning capacity for each level is undersized for the areas that they serve; additional air conditioning capacity is required.
2. Zoning: The Intermediate Level and First Level are single, large heating and air conditioning zones that serve several different occupancies and exposures controlled by a single thermostat. Each zone at each level has differing heating and cooling requirements during the day as affected by the outside air temperature, location of the sun and occupancy that can't be adequately addressed by a single thermostat.
3. Thermostat Locations: Thermostat locations are not ideal; the thermostats control the heating and air conditioning of the rooftop unit. In this situation, the only space that is truly satisfied is the area that the thermostat is located; all other areas are dependent on that location.
4. Rooftop Units: The issue with gas fired/electric cool rooftop units in this particular application is that they are only capable of providing conditioned supply air when the thermostat calls for either heating or cooling; otherwise, they are providing unconditioned air at the mixed air temperature (return/outdoor air) to each space until the thermostat calls for heating or cooling although spaces outside the thermostat area already do not feel satisfied. In other words, a particular space within the single HVAC zone may already feel cold in the winter and the supply

air from the rooftop unit feels cool or the air they may feel hot in the summer time and the supply air from the rooftop unit feels warm because the thermostat is satisfied.

5. Rooftop Units: The rooftop units are at the end of their anticipated life expectancy and will need to be replaced in the near future.
6. Exhaust/Ventilation: Provisions for exhaust and ventilation should be added to crawlspace, utility room and storage rooms in conformance with applicable codes.
7. Elevator Machine Room: The elevator machine room has strict space temperature limitations; if the machine room has noted high space temperatures, a small split system should be added to adequately maintain the space temperature within the room.
8. Balancing/Commissioning: It is not clear if the systems were ever properly balanced and/or commissioned which could be significantly impacting the operation of the system.

## **RECOMMENDATIONS**

### **Option 1 - Existing System Upgrades**

1. Add supplemental cooling to the building through variable refrigerant systems with individual controls to provide additional cooling capacity and zoning to each of the building systems; the interior portion of the system could include either wall or ceiling mounted units interconnected to an exterior heat pump by interconnecting refrigerant piping system with applicable controls to provide heating/cooling to individual zones throughout the building. The rooftop units and through wall units could operate to provide the first level of heating/cooling to the building while the new variable refrigerant system could provide supplemental heating and cooling to the building and offering the additional benefit of adding zoning to the individual heating and cooling zones in the building.
2. Add controls for demand control ventilation and discharge air temperature control.
3. Provide additional exhaust/ventilation systems for crawlspace, utility room and storage rooms.
4. Provide split system air conditioning system for elevator machine room.
5. Balance existing system to calculated airflows for heating and cooling.
6. Commission systems for proper sequence of operation.

The estimated construction costs for Option 1 is **\$ 119,226.00**.

### **Option 2 – Replace Existing System**

1. Replace existing rooftop units and bathroom exhaust fan.
2. Add supplemental cooling to the building through variable refrigerant systems with individual controls to provide additional cooling capacity and zoning to each of the building systems; the interior portion of the system could include either wall or ceiling mounted units interconnected

to an exterior heat pump by interconnecting refrigerant piping system with applicable controls to provide heating/cooling to individual zones throughout the building. The rooftop units and through wall units could operate to provide the first level of heating/cooling to the building while the new variable refrigerant system could provide supplemental heating and cooling to the building and offering the additional benefit of adding zoning to the individual heating and cooling zones in the building.

3. Add building management system to remote monitor, adjust and control the entire building HVAC system.
4. Add controls for existing roof intake hoods.
5. Add controls for Lower Level Packaged Through Wall Terminal Units.
6. Add controls for demand control ventilation and discharge air temperature control.
7. Provide additional exhaust/ventilation systems for crawlspace, utility room and storage rooms.
8. Provide split system air conditioning system for elevator machine room.
9. Balance existing system to calculated airflows for heating and cooling.
10. Commission systems for proper sequence of operation.

The estimated construction costs for Option 1 is **\$ 298,056.00**.

## Unit Report For RTU-1

Project: Sturbridge Public Library  
 Prepared By:

07/26/2017  
 11:41AM

### Unit Parameters

Unit Model:..... **48TCFE16ACA6-0F2C0**  
 Unit Size:..... **16 (15 Tons)**  
 Volts-Phase-Hertz:..... **460-3-60**  
 Heating Type:..... **Gas**  
 Duct Cfg:..... **Vertical Supply / Vertical Return**  
 High Heat  
 Round Tube Plate Fin Coils

### Dimensions (ft. in.) & Weight (lb.) \*\*\*

Unit Length:..... **9' 7.875"**  
 Unit Width:..... **5' 3.375"**  
 Unit Height:..... **4' 9.375"**  
 \*\*\* Total Operating Weight:..... **1718 lb**

\*\*\* Weights and Dimensions are approximate. Weight does not include unit packaging. Approximate dimensions are provided primarily for shipping purposes. For exact dimensions and weights, refer to appropriate product data catalog.

### Lines and Filters

Gas Line Size:..... **3/4**  
 Condensate Drain Line Size:..... **3/4**  
 Return Air Filter Type:..... **Throwaway**  
 Return Air Filter Quantity:..... **6**  
 Return Air Filter Size:..... **18 x 24 x 2**

### Unit Configuration

High Static Option with High Efficiency Motor (Belt Drive)  
 Al/Cu - Al/Cu  
 Base Electromechanical Controls  
 Enthalpy Economizer w/ Barometric Relief  
 Powered Convenience Outlet  
 Non-Fused Disconnect  
 Standard Packaging  
 Humidi-MiZer™ Adaptive Dehumidification System

### Warranty Information

1-Year parts(std.)  
 5-Year compressor parts(std.)  
 10-Year heat exchanger - Aluminized(std.)

No optional warranties were selected.

**NOTE: Please see Warranty Catalog 500-089 for explanation of policies and ordering methods.**

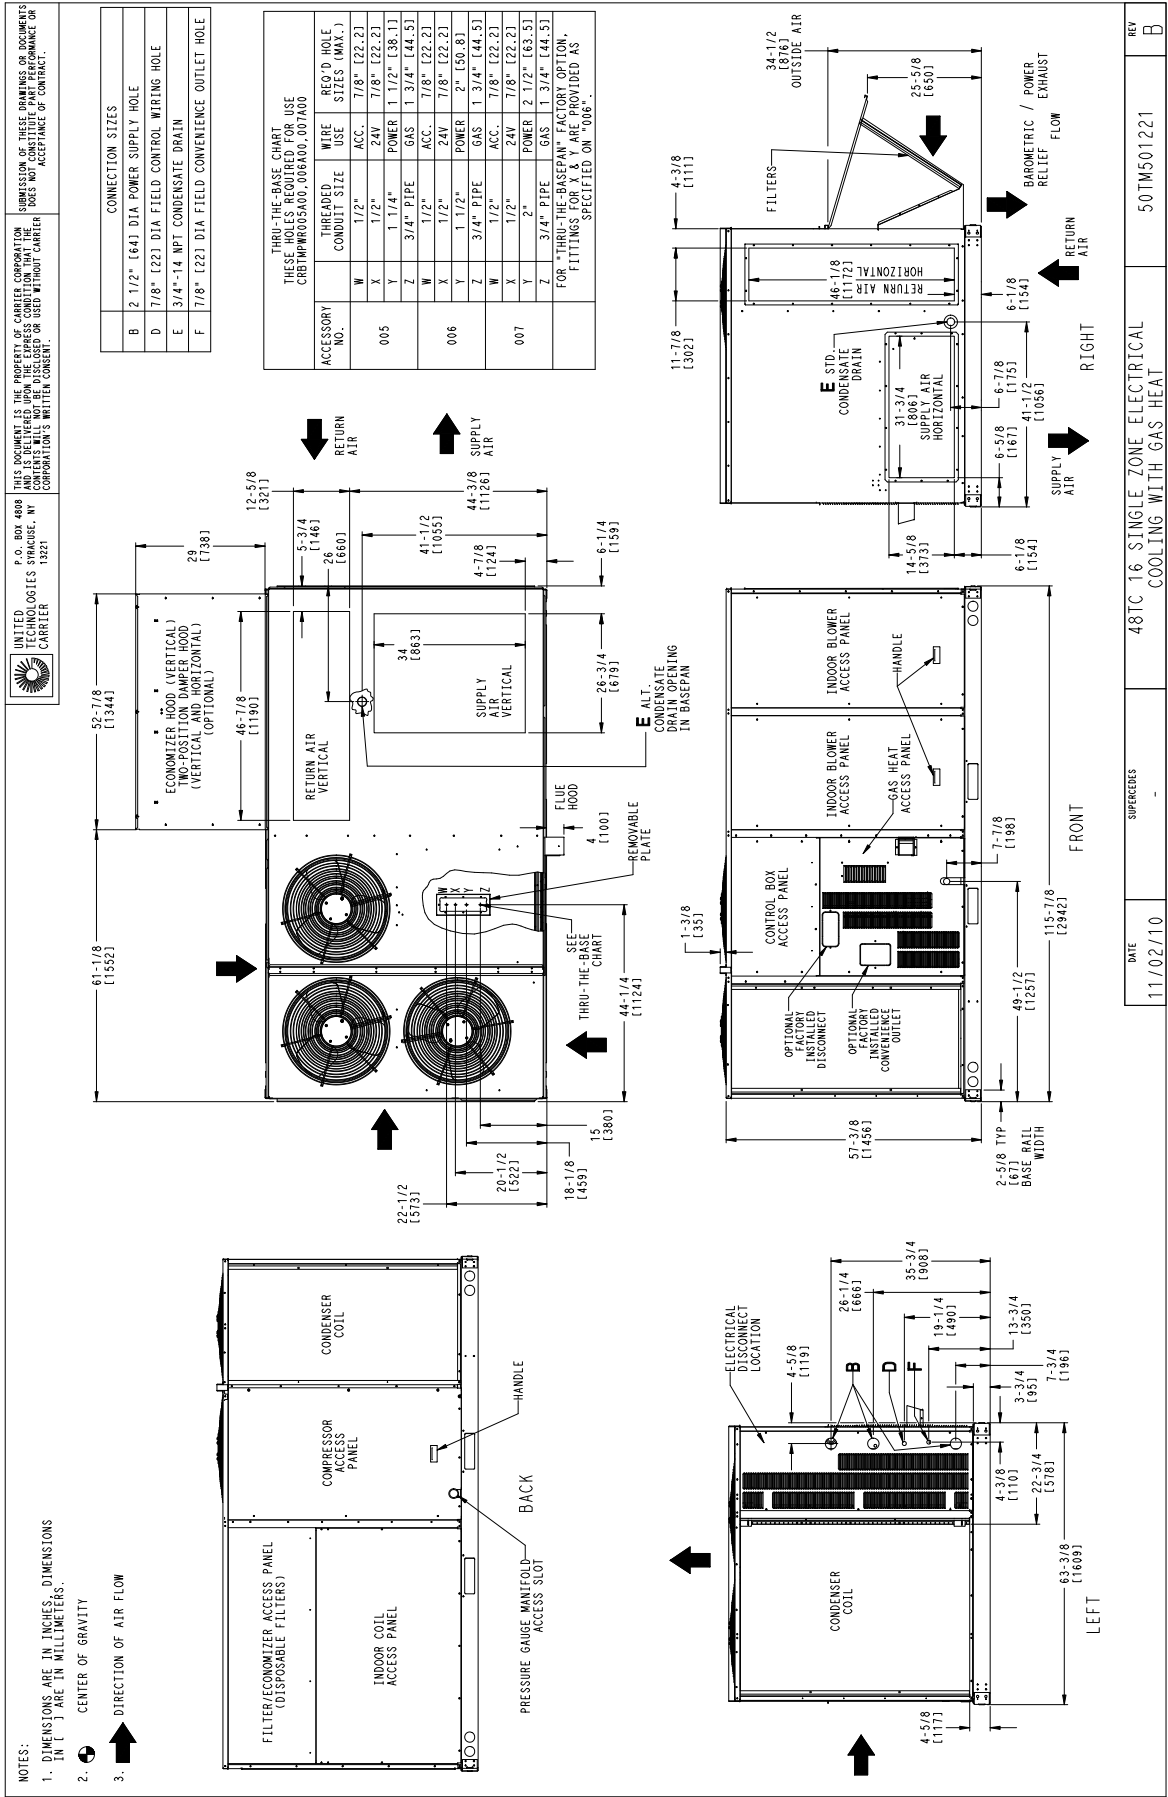

### Ordering Information

Part Number	Description	Quantity
48TCFE16ACA6-0F2C0	Rooftop Unit	1
	Base Unit	
	High Static Option with High Efficiency Motor (Belt Drive)	
	Powered Convenience Outlet	
	Std leak Enty Econo IV with baro relief and W7212 control	
	Non-Fused Disconnect

### FEATURES

- ONE PIECE WELDED CONSTRUCTION
- FACTORY INSTALLED SUPPLY TRANSITIONS
- FULLY INSULATED
- DESIGNED FOR EVEN WEIGHT DISTRIBUTION
- FABRICATED OF HEAVY GAUGE G90 GALVANIZED STEEL
- ALL WELDS SPRAYED WITH GALVANIZING COMPOUND
- GASKET PROVIDED FOR UNIT TO ADAPTER SEALING

Existing Unit  
48HJF017 (CARRIER)

New Unit  
48TCFD16 (CARRIER)

**CAMBRIDGEPORT STRONGLY RECOMMENDS CONFIRMING THE DIMENSIONS ON THIS SUBMITTAL**

CURB ADAPTERS ARE BASED ON UNIT MANUFACTURERS STANDARD CURB DIMENSIONS.  
CAMBRIDGEPORT CANNOT BE RESPONSIBLE FOR ANY DEVIATIONS FROM FACTORY DIMENSIONS OR INCORRECT MODEL NUMBERS.

Calculation methods used in this program are patterned after the ASHRAE Guide; other ASHRAE Publications and the AHRI Acoustical Standards. While a very significant effort has been made to insure the technical accuracy of this program, it is assumed that the user is knowledgeable in the art of system sound estimation and is aware of the tolerances involved in real world acoustical estimation. This program makes certain assumptions as to the dominant sound sources and sound paths which may not always be appropriate to the real system being estimated. Because of this, no assurances can be offered that this software will always generate an accurate sound prediction from user supplied input data. If in doubt about the estimation of expected sound levels in a space, an Acoustical Engineer or a person with sound prediction expertise should be consulted.

## Fan Curve

Medium Static Option (Belt Drive)  
 Al/Cu - Al/Cu  
 Base Electromechanical Controls  
 Enthalpy Economizer w/ Barometric Relief  
 Powered Convenience Outlet  
 Non-Fused Disconnect  
 Standard Packaging  
 Humidi-MiZer™ Adaptive Dehumidification System

### Warranty Information

1-Year parts(std.)  
 5-Year compressor parts(std.)  
 10-Year heat exchanger - Aluminized(std.)

No optional warranties were selected.

**NOTE: Please see Warranty Catalog 500-089 for explanation of policies and ordering methods.**

### Ordering Information

Part Number	Description	Quantity
48TCFE08A2A6-0F2C0	Rooftop Unit	1
	Base Unit	
	Medium Static Option (Belt Drive)	
	Powered Convenience Outlet	
	Std leak Enty Econo IV with baro relief and W7212 control	
	Non-Fused Disconnect

- D A-Weighted Sound Pressure Levels at Specific Distance from Unit, LpA

Calculation methods used in this program are patterned after the ASHRAE Guide; other ASHRAE Publications and the AHRI Acoustical Standards. While a very significant effort has been made to insure the technical accuracy of this program, it is assumed that the user is knowledgeable in the art of system sound estimation and is aware of the tolerances involved in real world acoustical estimation. This program makes certain assumptions as to the dominant sound sources and sound paths which may not always be appropriate to the real system being estimated. Because of this, no assurances can be offered that this software will always generate an accurate sound prediction from user supplied input data. If in doubt about the estimation of expected sound levels in a space, an Acoustical Engineer or a person with sound prediction expertise should be consulted.
